## A Lighter Touch in Permanent Hair Removal

Today, approximately 80 percent of men and women aged 16 to 60 remove face and body hair regularly. Shaving or chemical gels only remove hair at the surface of the skin, giving you short-term results. Slightly more long-term are methods like wax or electric epilators that painfully pull the hair out somewhere along the shaft.

### New Technology

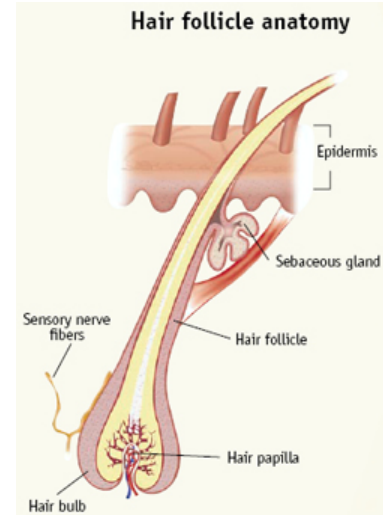

Using unique LHE (Light Heat Energy) technology enables hair removal from virtually any part of the body (except eyebrows), safely, quickly and efficiently.

### LHE Technology – How it works

A human hair is made of three main parts:

- The hair shaft
- The follicle
- The bulb

To remove hair and damage the bulb, LHE sends out a very low and ultra safe wave of light. The light generates heat and is drawn to the hair follicle, allowing the heat to flow through the hair shaft. The hair shaft then absorbs the heat and transfers it down to the bulb, damaging the bulb and greatly inhibiting hair re-growth.

### Gain Confidence and be Free from Hair Removal

With LHE you can achieve permanent hair reduction. Treatments are performed monthly for several months depending on the area being treated, with most areas requiring 5 – 8 treatments for effective long term removal.

By gently removing the hair down to the source and damaging the bulb (root), LHE significantly disrupts hair re-growth. LHE treatment is safe and effective and has no harmful side effects.

For more technical information about LHE and photos of before and after treatments, visit:
